

Rapid Decision Making in Humans

Lucine Oganessian

Smith Lab

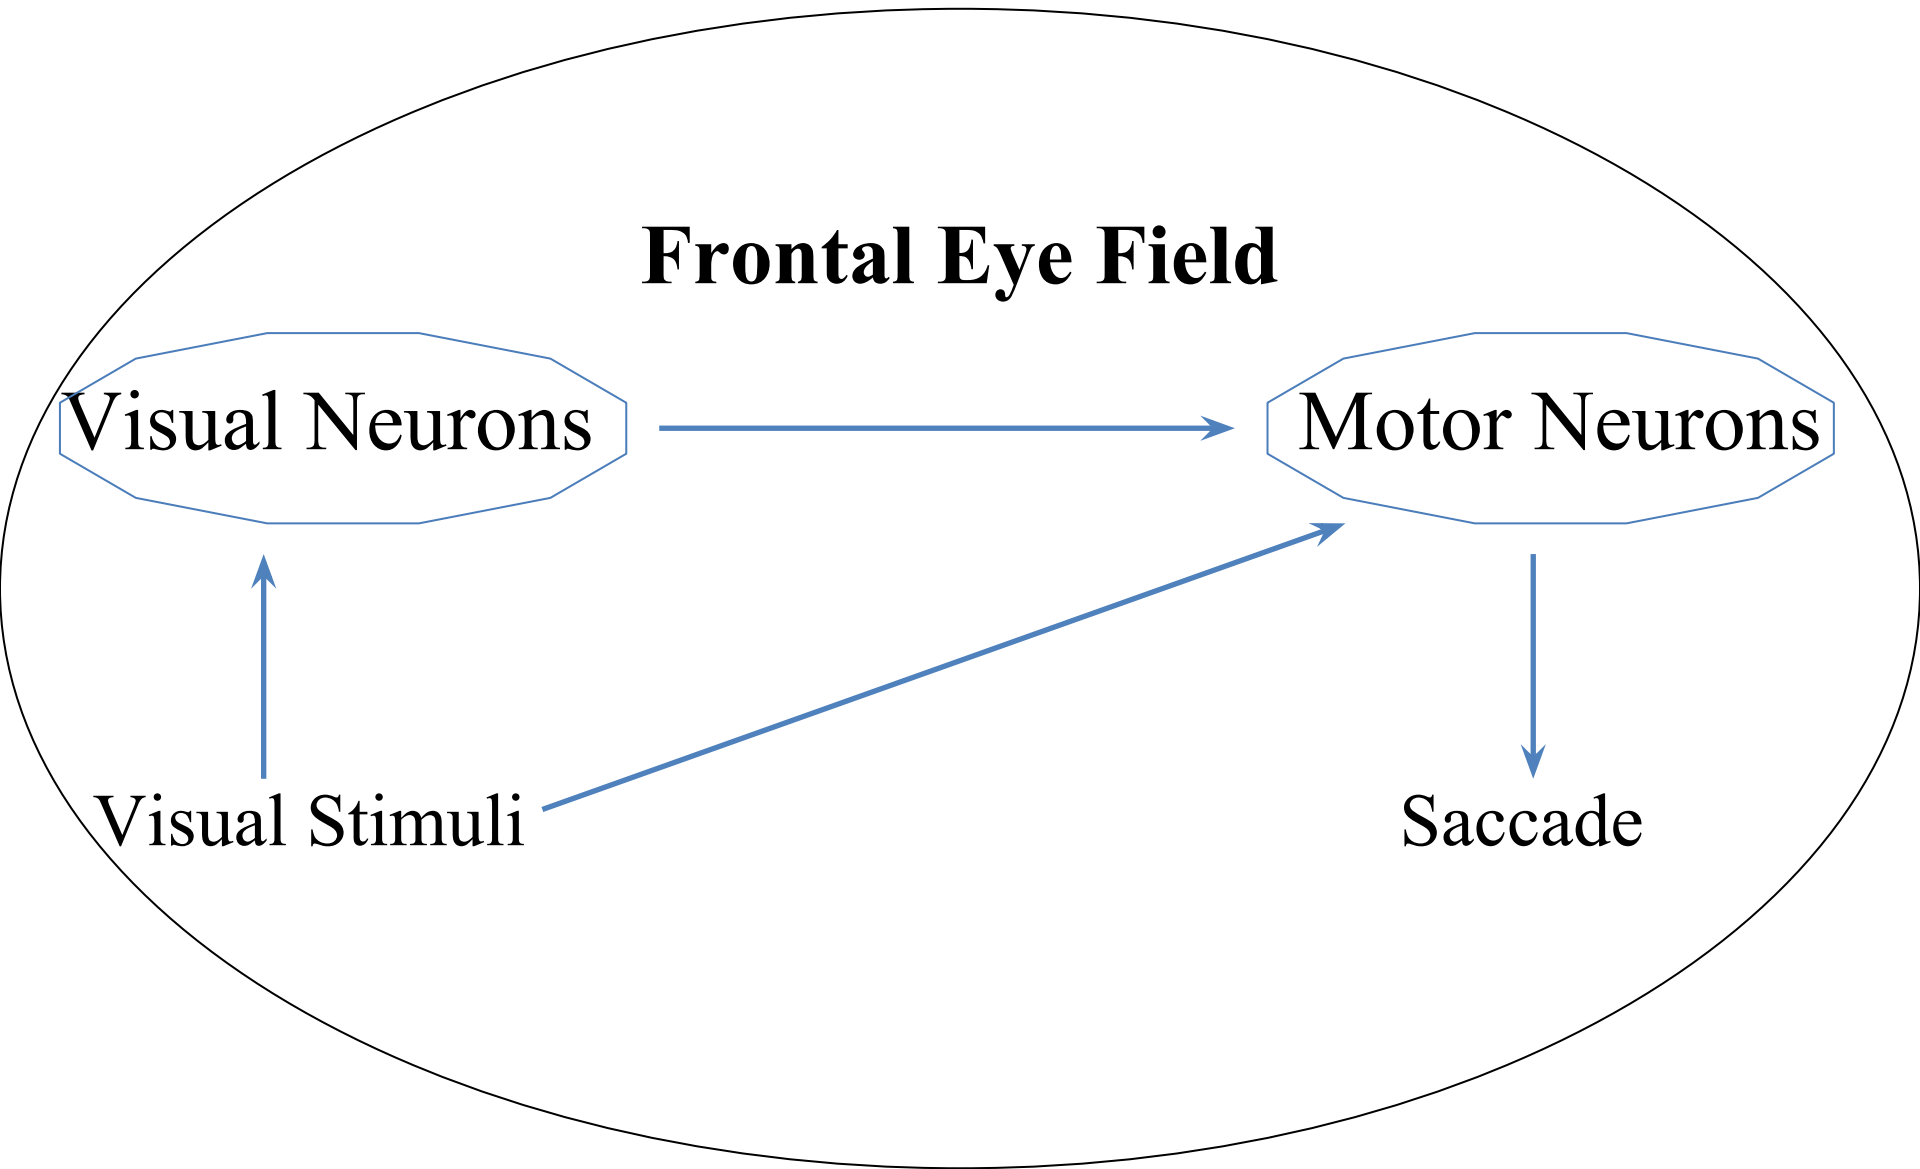

- **Introduction**
- Background and task
- Results from human psychophysics experiment
- Conclusion and future direction

Frontal eye fields (FEF) play role in visual perception and eye movements

<http://www.polyvore.com/cgi/img-thing?.out=jpg&size=l&tid=33184508>

Perceptual modulation in motor responses (in FEF)

- Introduction
- **Background and task**
- Results from human psychophysics experiment
- Conclusion and future

Presenting target information at variable times after movement is initiated

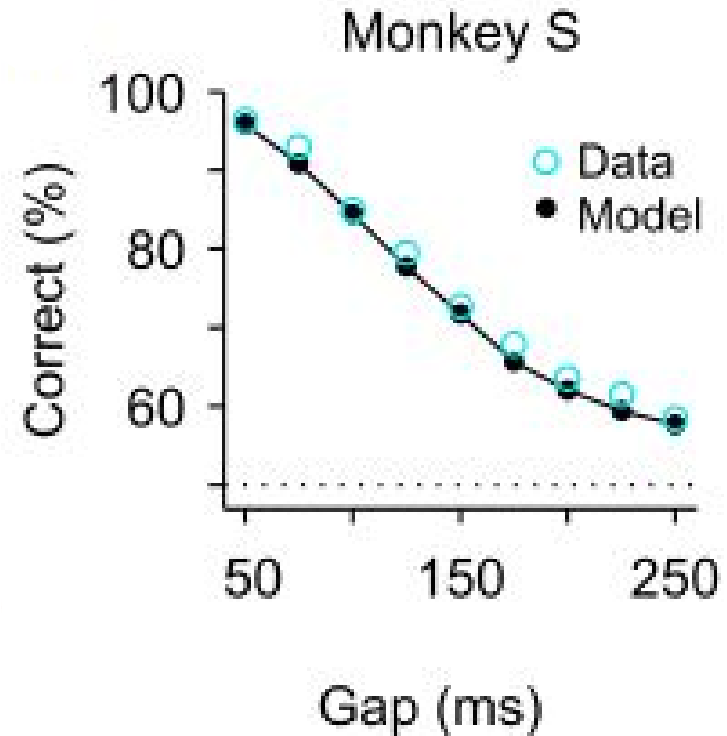

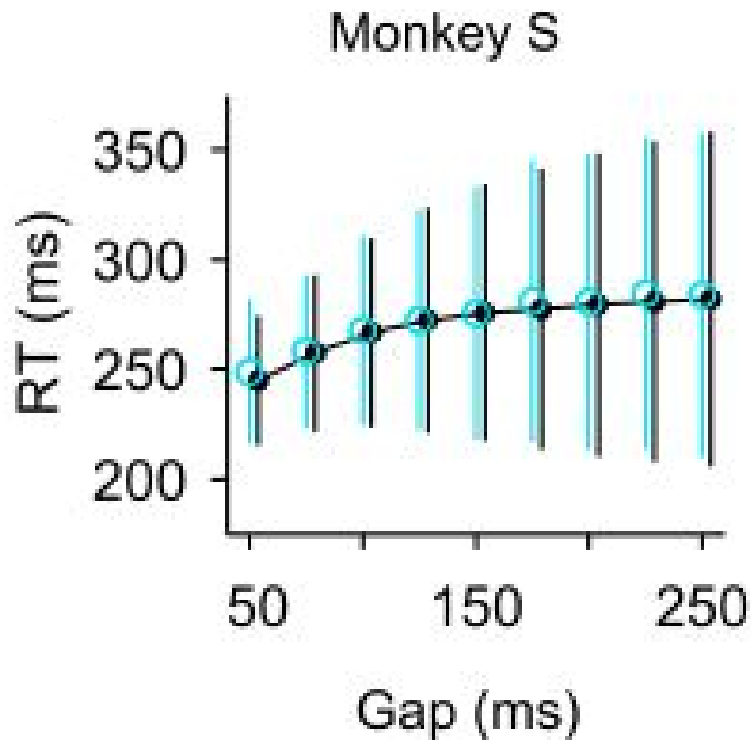

Raw
Processing
Time

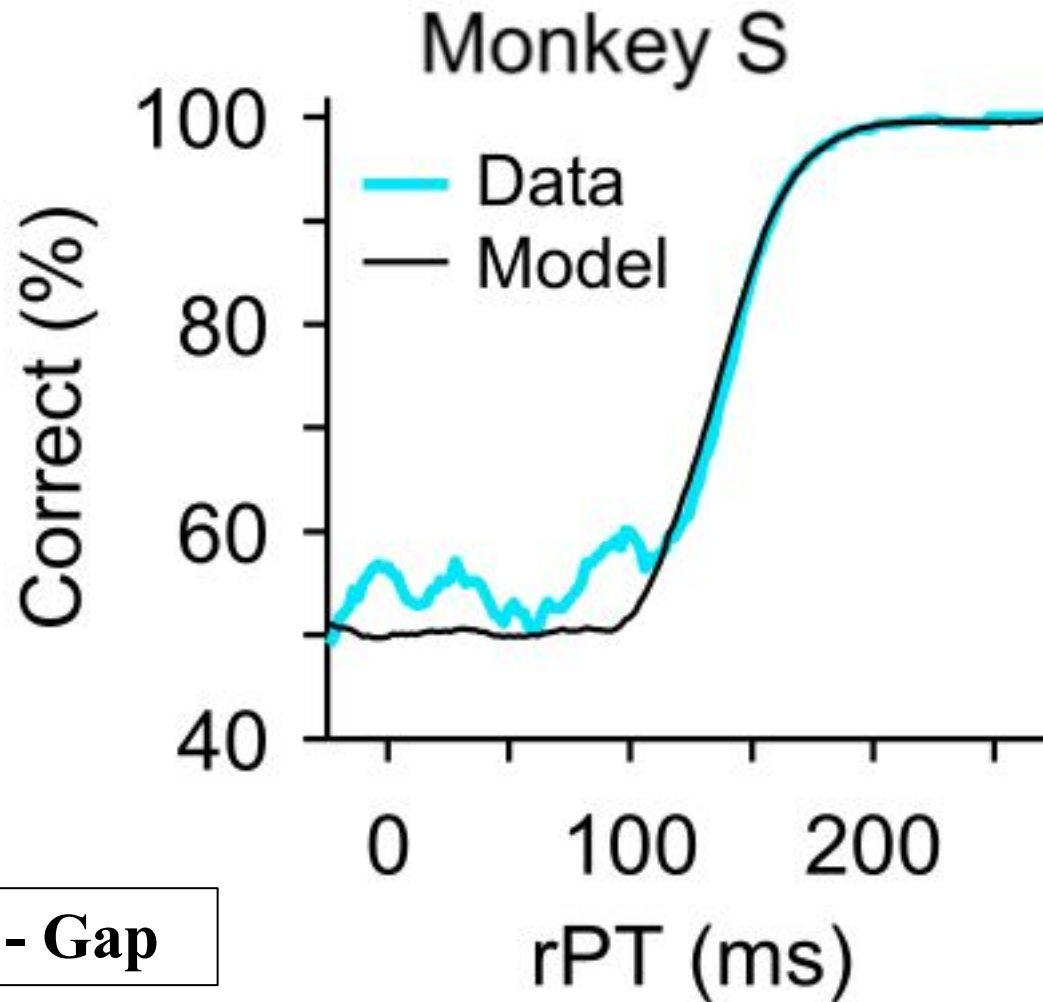

$$\mathbf{rPT = RT - Gap}$$

Response
Time

Percent correct decreases with increasing gap time, while response times remain consistent

Longer raw processing times associated with higher percentage correct

$$\text{rPT} = \text{RT} - \text{Gap}$$

- Introduction
- Background and task
- **Results from human psychophysics experiment**
- Conclusion and future direction

Response times not dependent on gap times

Subject A

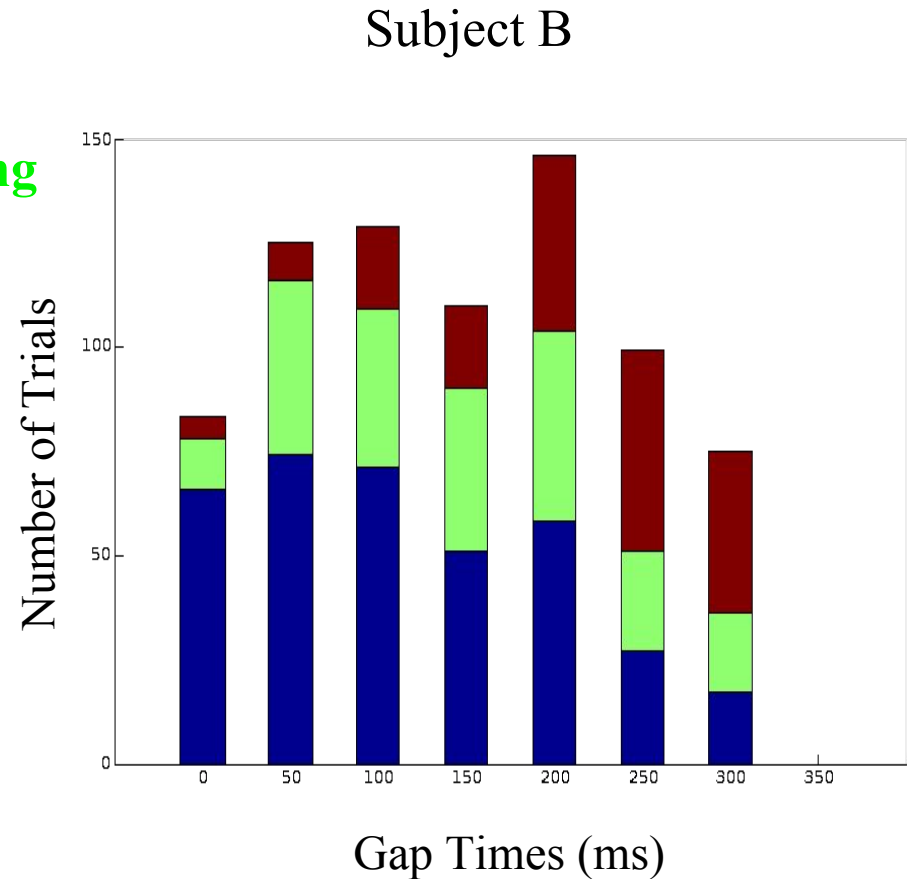

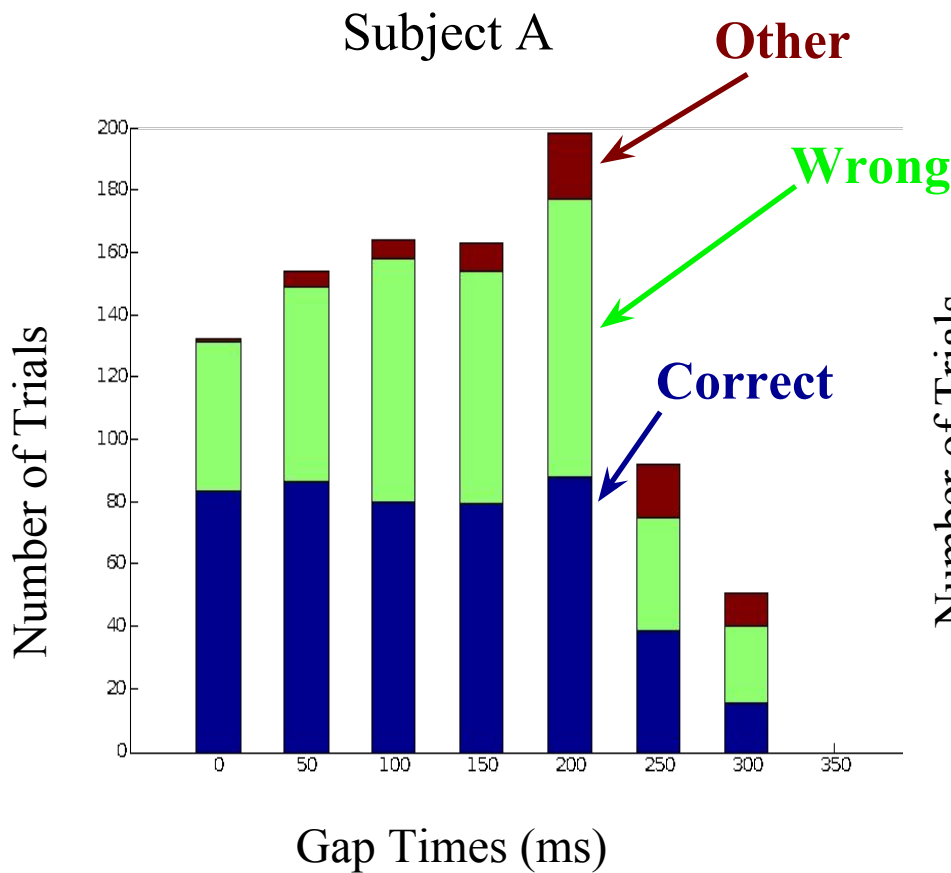

Subject B

Gap Times (ms)

Proportion of correct trials decreases with larger gap times

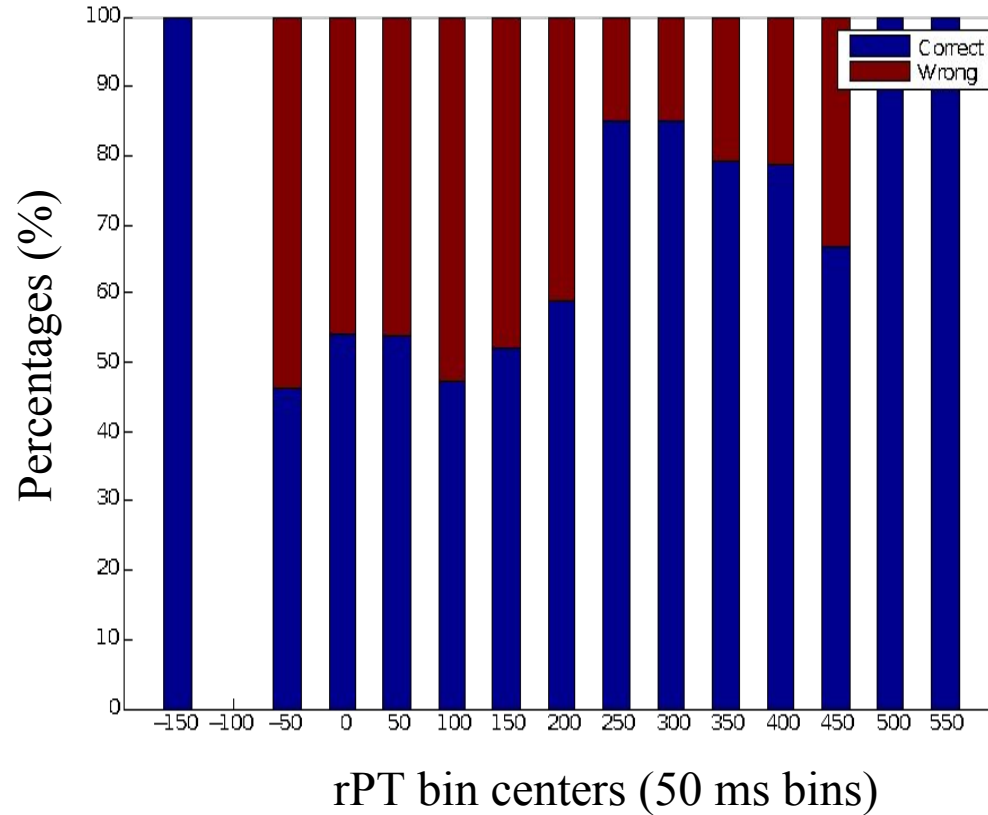

Correct trials associated with longer raw processing times

Correct Trials

Incorrect Trials

Number of Occurrences

rPT bin centers (50 ms bins)

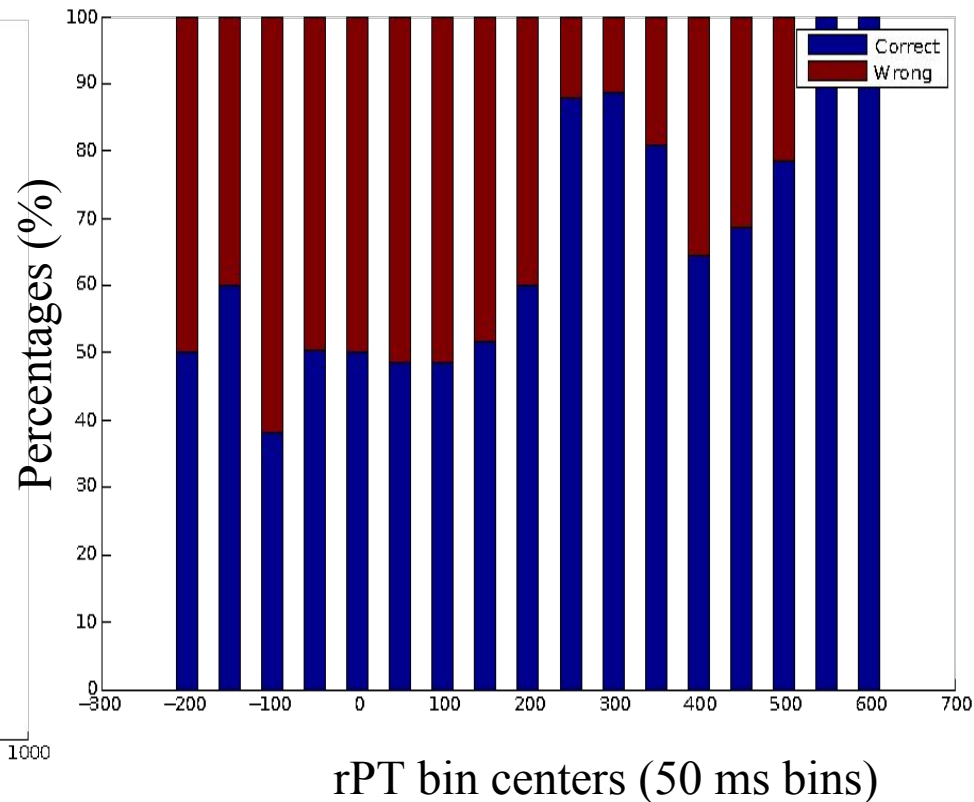

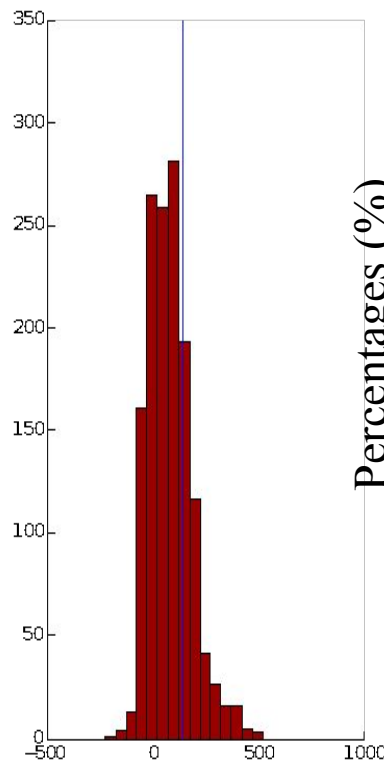

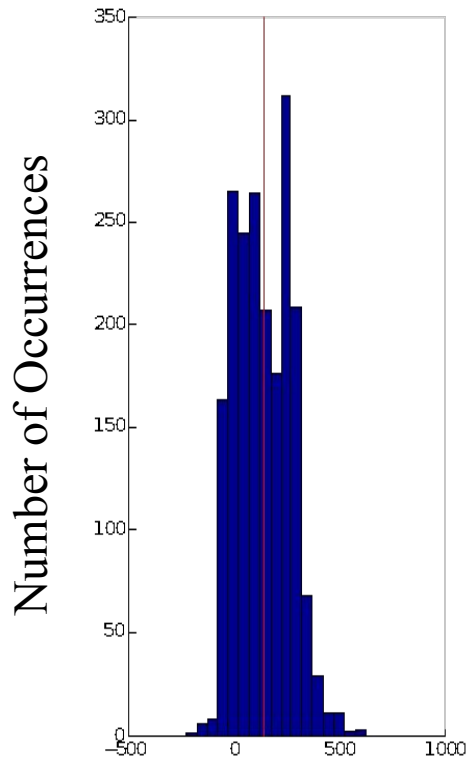

Subject B

$$\mathbf{rPT = RT - Gap}$$

Pooled across all subjects, correct trials appear to tend towards longer rPT values.

Correct Trials

Incorrect Trials

rPT bin centers (50 ms bins)

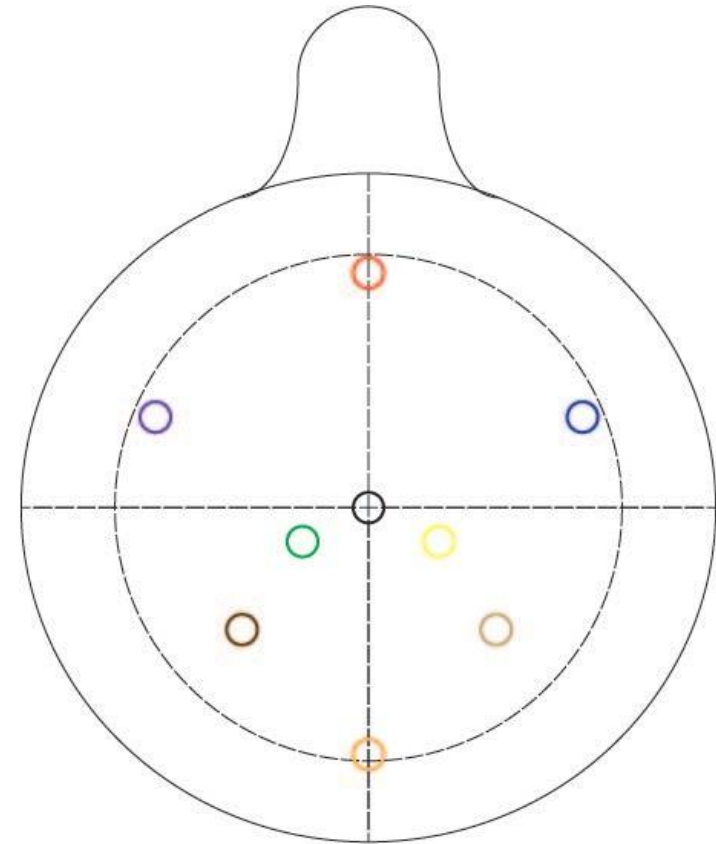

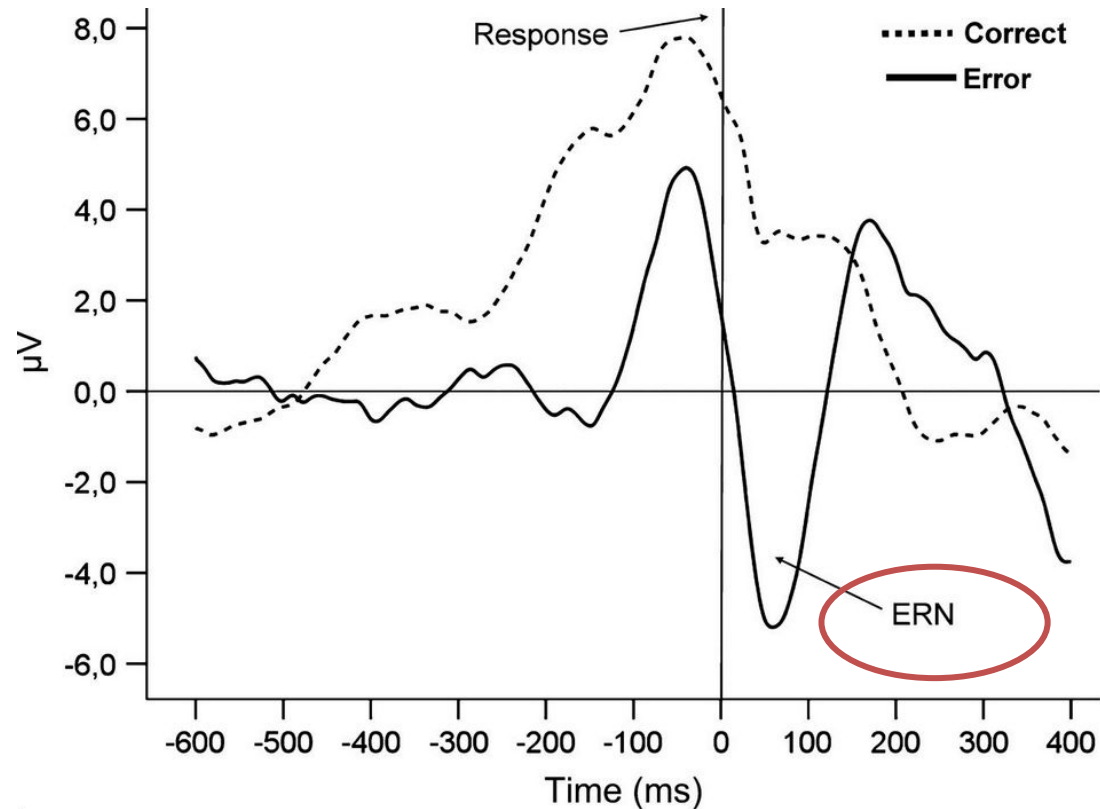

- Introduction
- Background and task
- Results from human psychophysics experiment
- **Conclusion and future direction**

Next steps

- Preliminary results appear to be consistent with Stanford's experiment
- Looking at perceptual modification in patients with Parkinson's and ADHD

Looking at Event Related Potentials (ERPs) from EEG recordings for perceptual error elements

Error Related Negativity
